# 11-EXCEPTION HANDLING

Ex. No: 11.1 Date:

02.06.24

Register No.: 2116230401126 Name: Rachanaa R U

# **EXCEPTION HANDLING**

To find whether a digit lies in the specified range (1-100). Handling exceptions for invalid inputs and out-of-range numbers .

Input Format:

User inputs a number.

Output Format:

Confirm the input or print an error message if it's invalid or out of range.

### For example:

Input	Result
1	Valid input.
101	Error: Number out of allowed range
rec	Error: invalid literal for int()

# Program:

```
try:
    a=input()
    if(int(a)>0 and int(a)<101):
        print("Valid input.")
    else:
        print("Error: Number out of allowed range")
except:
    print("Error: invalid literal for int()")</pre>
```

✓ 1 Valid input. Valid input.	
	~
✓ 100 Valid input. Valid input.	~
✓ 101 Error: Number out of allowed range Error: Number out of	lowed range 🗸

Ex. No: 11.2 Date:

Register No.: 2116230401112 Name : NIVETHA.G

# **EXCEPTION HANDLING**

Write a Python program that performs division and modulo operations on two numbers provided by the user. Handle division by zero and non-numeric inputs.

### Input Format:

Two lines of input, each containing a number.

### Output Format:

Print the result of division and modulo operation, or an error message if an exception occurs.

### For example:

Input	Result
10	Division result: 5.0
2	Modulo result: 0
7	Division result: 2.3333333333333333
3	Modulo result: 1
8	Error: Cannot divide or modulo by zero.
0	

#### **Program:**

```
try:
    a=input()
    b=input()
    c=int(a)/int(b)
    d=int(a)%int(b)

except ZeroDivisionError:
    print("Error: Cannot divide or modulo by zero.")

except:
    print("Error: Non-numeric input provided.")

else:
    print("Division result:",c)
    print("Modulo result:",d)
```

	Input	Expected	Got
<b>*</b>	10	Division result: 5.0 Modulo result: 0	Division result: 5.0 Modulo result: 0
<b>~</b>	7	Division result: 2.333333333333333333333333333333333333	Division result: 2.333333333333333333333333333333333333
<b>~</b>	8	Error: Cannot divide or modulo by zero.	Error: Cannot divide or modulo by zero.
<b>~</b>	abc 5	Error: Non-numeric input provided.	Error: Non-numeric input provided.

Ex. No: 11.3 Date:

Register No.: 2116230401112 Name : NIVETHA.G

# **EXCEPTION HANDLING**

Write a Python program that asks the user for their age and prints a message based on the age. Ensure that the program handles cases where the input is not a valid integer.

**Input Format:** A single line input representing the user's age.

**Output Format:** Print a message based on the age or an error if the input is invalid.

# For example:

Input	Result
twenty	Error: Please enter a valid
	age.
25	You are 25 years old.
-1	Error: Please enter a valid
	age.

# Program:

```
try:
    a=input()
    if int(a)>=0:
        print("You are",a,"years old.")
    else:
        print("Error: Please enter a valid age.")
except:
    print("Error: Please enter a valid age.")
```

	Input	Expected	Got	
~	twenty	Error: Please enter a valid age.	Error: Please enter a valid age.	~
~	25	You are 25 years old.	You are 25 years old.	~
~	-1	Error: Please enter a valid age.	Error: Please enter a valid age.	~
~	150	You are 150 years old.	You are 150 years old.	~
~		Error: Please enter a valid age.	Error: Please enter a valid age.	~

### **EXCEPTION HANDLING**

Develop a Python program that safely calculates the square root of a number provided by the user. Handle exceptions for negative inputs and non-numeric inputs.

Input Format:

User inputs a number.

Output Format:

Print the square root of the number or an error message if an exception occurs.

#### For example:

Input	Result	
16	The square root of 16.0 is 4.00	
-4	Error: Cannot calculate the square root of a negative number.	
rec	Error: could not convert string to float	

#### **Program:**

import math

try:

n=input()

```
\begin{split} &n{=}\text{float}(n) \\ &\text{if } n < 0; \\ &\text{print}(\text{"Error: Cannot calculate the square root of a negative number."}) \\ &\text{else:} \\ &\text{r= math.sqrt}(n) \\ &\text{print}(\text{"The square root of } \{\} \text{ is } \{:.2f\}\text{".format}(n,r)) \end{split}
```

# except ValueError:

print("Error: could not convert string to float")

		Input	Expected	Got	
•	/	16	The square root of 16.0 is 4.00	The square root of 16.0 is 4.00	~
١,	/	0	The square root of 0.0 is 0.00	The square root of 0.0 is 0.00	~
•	/	-4	Error: Cannot calculate the square root of a negative number.	Error: Cannot calculate the square root of a negative number.	~

Ex. No: 11.5 Date: 02.06.24

Register No.: 2116230401112 Name: NIVETHA.G

# **EXCEPTION HANDLING**

Develop a Python program that safely performs division between two numbers provided by the user. Handle exceptions like division by zero and non-numeric inputs.

**Input Format:** Two lines of input, each containing a number.

**Output Format:** Print the result of the division or an error message if an exception occurs.

For example:

Input	Result
10	5.0
2	
10	Error: Cannot divide or modulo by zero.
0	
ten	Error: Non-numeric input provided.
5	

### Program:

```
try:
    a=input()
    b=input()
    c=float(a)/float(b)
except ZeroDivisionError:
    print("Error: Cannot divide or modulo by zero.")
except:
    print("Error: Non-numeric input provided.")
else:
    print(c)
```

	Input	Expected	Got	
~	10	5.0	5.0	~
~	10	Error: Cannot divide or modulo by zero.	Error: Cannot divide or modulo by zero.	~
~	ten 5	Error: Non-numeric input provided.	Error: Non-numeric input provided.	~
